

Business strategy

COPY-PASTE PROMPT Business diagnostic before rewriting

Act as a senior business strategist, customer researcher and honest business-plan editor. I am attaching my small-business concept. Do not rewrite it yet. First analyse it objectively based only on what is explicitly written.

Please provide:

1. Strongest value propositions – List the strongest customer benefits and the evidence supporting each one.
2. Weak / unclear sections – Identify vague, weak, repetitive, unrealistic or confusing parts and explain why.
3. Missing information – Tell me what important market, customer, pricing or operational information is missing.
4. Business narrative – Can the business idea be explained clearly in one sentence? If yes, give the sentence; if not, explain why.
5. Best-fit customer segments – List the top 3–5 segments that appear strongest based only on the current concept.
6. Priority table: Issue | Why It Matters | Priority (0–10) | Exact Information Needed

Rules:

- Do not infer market size, traction or customer demand that is not written.
- Distinguish missing evidence from missing capability.
- Be honest and critical.
- Evaluate from both customer and business perspectives.

At the end, ask up to 5 specific questions needed to improve the business plan, then wait for my answers.

Response:

1. Strongest value proposition and evidence

- Personalised shopping experience: The concept explicitly focuses on using customer preferences to improve product discovery.
- Automated customer support: The proposed workflow reduces repetitive questions and provides faster responses.
- Inventory visibility: The concept connects product information with availability, helping customers make better purchase decisions.
- Data-supported merchandising: The plan proposes using customer and sales signals to identify products and trends.

No verified revenue, conversion, retention or customer-volume metrics are stated, so these should not be presented as achieved outcomes.

Business strategy — diagnostic response (continued)

2. Weak or unclear sections

- Target customer is broad and needs a clearly defined first segment.
- The proposed AI features are described at a high level without specifying the data required.
- Pricing and unit economics are not defined.
- There is no evidence of customer interviews, pilot users or conversion results.
- Operational ownership for inventory, support and model monitoring is unclear.

3. Missing information

- Customer segment and buying frequency.
- Current manual workflow and its cost.
- Product catalogue size and data quality.
- Expected order volume and support volume.
- Pricing model and estimated gross margin.
- Success metrics for the first pilot.

4. Business narrative

“An AI-enabled e-commerce assistant that helps shoppers discover relevant products faster while helping small retailers automate routine customer support and merchandising decisions.”

5. Best-fit customer segments today

- Small online fashion retailers
- Direct-to-consumer lifestyle brands
- Specialty electronics stores with large catalogues
- Local retailers moving from social commerce to web stores
- Growing e-commerce businesses with lean support teams

6. Priority Table

Issue	Why It Matters	Priority	Exact Information Needed
Target segment	Determines product design and messaging	9	First customer segment and buying behaviour
AI data inputs	Determines technical feasibility	8	Catalogue, reviews, orders and customer-event fields
Pricing	Tests commercial viability	8	Customer willingness-to-pay and cost assumptions
Pilot evidence	Reduces execution risk	9	Interview/pilot results and measurable outcomes
Success metrics	Defines whether the product works	8	Conversion, response time, repeat use and support metrics

Business strategy — opportunities and implementation

Find opportunities that fit the concept

COPY-PASTE PROMPT Based on my business concept and the customer direction below, identify 10 practical AI-enabled product opportunities I should test.

Target direction: [AI shopping assistant / AI merchandising / AI customer-support workflow]

Customer type: [small and mid-sized e-commerce retailers]

Location / market: []

Minimum business value: []

Industries to prioritise or avoid: []

For each opportunity, provide:

- Likely product or feature name and variations
- Why the current concept supports it
- Biggest implementation gap
- Keywords / tools to research
- Fit score (0–100)
- Recommendation: Test now / Test after a small prototype / Skip

Rules

- Match the actual workflow, not merely the presence of “AI” in the idea.
- Base the assessment primarily on the supplied concept.
- Do not assume customers, revenue or technical capabilities that are not demonstrated.
- Prioritise opportunities with visible proof of value.

Response — Ranked opportunities

Opportunity	Why it fits	Biggest gap	Score	Recommendation
AI product finder	Directly supports product discovery	Need catalogue + preference data	82	Test now
Customer-support copilot	Automates repetitive questions	Need FAQ/order integration	79	Test now
Review summariser	Turns feedback into product insight	Need review dataset	76	Prototype
Inventory alert assistant	Supports stock decisions	Need reliable inventory feed	73	Prototype
Merchandising copilot	Helps select/promote products	Need sales history	70	Prototype

Top 3

1. AI product finder — closest to the core customer value and easy to demonstrate.
2. Customer-support copilot — clear operational benefit and measurable response-time improvement.
3. Review summariser — small prototype can prove usefulness before a larger build.

Business strategy — customer and stakeholder variants

30-day gap-closing plan

COPY-PASTE PROMPT Using the business gap analysis, create a realistic 30-day learning and proof-of-work plan. For each gap include whether it is a knowledge, evidence or experience gap; priority 0–10; smallest learning task; one prototype artifact; how to describe it honestly; time estimate; and success check. Limit the plan to [X] hours per week. Prioritise visible proof of skill over passive learning.

Strict customer discovery interviewer

COPY-PASTE PROMPT Act as a strict but fair prospective customer for this e-commerce AI product. Ask one question at a time and wait for my answer. Ask 10–15 questions covering current workflow, customer pain, existing tools, buying criteria, implementation constraints, budget and what happens if the product fails. Challenge vague claims and ask for evidence. After the final question, give a full debrief with an overall score, strongest answers, weakest answers, missed opportunities and a 3-day preparation plan.

Investor grilling variant

COPY-PASTE PROMPT Act as a sceptical seed-stage investor. I am presenting an AI-enabled e-commerce product. Ask one hard question at a time about market, customer pain, differentiation, traction, distribution, business model, team and risks. Do not accept broad answers; ask for evidence, assumptions and numbers. After 12 questions, provide an investment-readiness score, five biggest unanswered risks and the exact data or slides I should improve.

Tough client meeting variant

COPY-PASTE PROMPT Act as the most demanding prospective retail client for the attached proposal. Ask one question at a time about scope, timelines, ownership, measurement, dependencies, cost, privacy, risks and what happens when the workflow fails. After 10 questions, create a client-objection sheet with: objection, what they are really worried about, evidence needed and a concise response.

Tool 2: Real-time research and idea generation with Grok

COPY-PASTE PROMPT Engagement-led research on X

COPY-PASTE PROMPT Act as a real-time social research analyst. Search X for public conversations about [e-commerce customer support / product discovery / online shopping] during [date range]. Prioritise meaningful engagement — replies, reposts, likes and views — rather than recency alone.

Analyse:

1. The top recurring shopping problems or questions.
2. The language people use to describe the problem.
3. Common complaints about existing shopping or support solutions.
4. Desired outcomes and willingness-to-pay signals.
5. High-engagement creators and communities discussing the topic.
6. Contrarian or emerging viewpoints.

Return:

- A table of themes with supporting links
- Short compliant excerpts rather than long copied text
- Engagement indicators
- A confidence level for each pattern
- 20 content or product ideas derived from the evidence

Separate observed evidence from interpretation. Do not invent posts, handles or metrics.

COPY-PASTE PROMPT Turn raw research into ranked ideas

COPY-PASTE PROMPT I am pasting research findings below. Generate 20 ideas for content, product features, campaigns or workshops for e-commerce retailers. Score each idea from 0–10 on audience pain intensity, evidence in the research, differentiation, ease of execution and business value. Rank the top five. For each top idea, state the exact evidence, the riskiest assumption and the smallest test I can run within seven days.

Tool 3: Build an AI team with Multi / model councils

COPY-PASTE PROMPT Council question — shared prompt for all models

COPY-PASTE PROMPT You are one member of an independent expert council evaluating the decision below.

Decision: Should a small e-commerce retailer deploy an AI customer-support assistant?

Context: The retailer receives repetitive product, delivery and return questions but has a small support team.

Evidence: [paste or attach customer messages, FAQ, order-volume data and cost information]

Analyse independently. Do not try to agree with other models.

Return:

1. Your recommendation.
2. The three strongest reasons.
3. The three biggest risks or failure modes.
4. Assumptions that could change the answer.
5. Missing evidence.
6. A low-cost test or next step.
7. Confidence from 0–100 and why.

COPY-PASTE PROMPT Convene the Judge — synthesis prompt

COPY-PASTE PROMPT Act as the chairperson judging multiple AI responses to the same business decision. Do not choose the most confident or longest answer. Evaluate reasoning and evidence.

- A. Points of consensus.
- B. Important disagreements and what causes them.
- C. Unique insights appearing in only one response.
- D. Unsupported claims or hallucination risks.
- E. Best combined recommendation.
- F. Conditions under which the recommendation should change.
- G. Decision table with option, upside, downside, evidence, risk and confidence.
- H. Next action a human should take before committing.

Second opinion / red-team pass

COPY-PASTE PROMPT Assume the current recommendation is wrong. Red-team it from the perspective of a sceptical store operator, customer, finance leader and e-commerce domain expert. Identify hidden assumptions, second-order effects, implementation risks and evidence that would falsify the recommendation. End with a revised recommendation or explain why the original still holds.

Tool 4: Create presentations with Kimi

COPY-PASTE PROMPT Create the story and 10-slide outline

COPY-PASTE PROMPT Act as a presentation strategist. Using the research below, design a 10-slide narrative for a small-business owner that helps them decide whether to adopt AI in e-commerce operations.

For each slide, provide:

- Slide title written as a takeaway
- The one message the audience must remember
- Supporting evidence or data
- Recommended visual (chart, comparison, timeline, process, image or table)
- Speaker note
- Source reference

Narrative requirements:

1. Start with the retailer's problem or decision.
2. Build a clear argument, not a list of facts.
3. Use one main idea per slide.
4. End with an explicit recommendation and next step.
5. Flag weak evidence instead of filling gaps.

COPY-PASTE PROMPT Generate the deck in Kimi Slides

COPY-PASTE PROMPT Create a fully editable 10-slide presentation using the outline below. Audience: small and mid-sized e-commerce owners. Objective: decide whether and where to introduce AI. Tone: analytical, practical and minimal. Visual direction: clean white space, dark text, green accent, product screenshots, simple charts and process diagrams.

Design rules:

- 16:9 widescreen.
- One clear takeaway per slide.
- Large readable text and generous whitespace.
- Use editable charts, diagrams and tables where possible.
- Use high-quality relevant imagery; avoid generic AI robots and visual clutter.
- Keep all claims traceable to sources.
- End with a concise action slide.

Tool 4: Create presentations with Kimi (continued)

Outline: [PASTE OUTLINE]

COPY-PASTE PROMPT Replicate a reference style responsibly

COPY-PASTE PROMPT I am uploading [2–5] reference slide images. First analyse the design system: colour palette, font characteristics, title hierarchy, spacing, grid, image treatment, shapes, chart style and recurring motifs. Then apply the same design logic to my new e-commerce content without copying logos, proprietary illustrations or brand-owned text. Keep the deck visually consistent and fully editable.

Tool 5: Excel and Google Sheets with Numerous.ai

COPY-PASTE PROMPT Generate a spreadsheet formula from plain English

COPY-PASTE PROMPT I want the values in cells F2, G2, H2, I2 and J2 combined into one line with a single space between each value. Give me the exact Google Sheets formula and explain it in one sentence. Handle blank cells without creating repeated spaces.

Use case	Example formula / instruction
Sentiment	=AI("Classify the product review as Positive, Negative or Neutral. Return only the label.",A2)
Product category	=AI("Classify into Fashion, Electronics, Home or Other. Return only one category.",A2)
Clean text	=AI("Correct spelling and standardize the product name. Return only the cleaned name.",A2)
Extract information	=AI("Extract the brand and product type from this text. If absent, return Not found.",A2)
Summarise	=AI("Summarise this customer feedback in 12 words or fewer.",A2)

COPY-PASTE PROMPT Design a reliable bulk-classification prompt

COPY-PASTE PROMPT Classify each product review into exactly one of these labels: [Positive], [Negative], [Neutral], [OTHER]. Return only the label. If the text is ambiguous or does not match, return OTHER. Do not create new labels.

Tool 5: Excel and Google Sheets with Numerous.ai (continued)

Bulk classification examples

Use case	Example formula / instruction
Sentiment	=AI("Classify the product review as Positive, Negative or Neutral. Return only the label.",A2)
Product category	=AI("Classify into Fashion, Electronics, Home or Other. Return only one category.",A2)
Clean text	=AI("Correct spelling and standardise the product name. Return only the cleaned name.",A2)
Extract information	=AI("Extract brand and product type. If absent, return Not found.",A2)
Summarise	=AI("Summarise this customer feedback in 12 words or fewer.",A2)

Reliable bulk-classification rules

- Return only one allowed label.
- Use definitions with examples before classifying.
- Return OTHER for ambiguous text.
- Do not create new labels.
- Test on a sample before filling an entire sheet.

Example application

A retailer can classify hundreds of product reviews into sentiment or topic labels, clean inconsistent product names, extract brands and generate short summaries. The output should be checked on a sample before being used for business decisions.

Tool 6: Data analysis and live dashboards with Claude

COPY-PASTE PROMPT Executive data analysis + interactive dashboard

COPY-PASTE PROMPT Act as a senior data scientist and strategy consultant. I am attaching an e-commerce CSV / spreadsheet.

Work in this order:

1. Audit the data: columns, data types, missing values, duplicates, outliers and limitations.
2. Identify the 4–5 strategic questions an e-commerce leader would ask.
3. Select one governing question that should organise the analysis.
4. Analyse the data and explain the method in plain English.
5. Build an interactive dashboard that answers the governing and supporting questions.
6. Use [brand colours / visual style] while keeping accessibility high.
7. Add filters only when they help a real decision.
8. Create an executive summary with key insights, business implications and recommended actions.
9. Include limitations and do not imply causation from correlation.

Quality rules:

- Never fabricate missing values.
- Show denominator and units for every metric.
- Verify calculations and reconcile totals.
- Flag results sensitive to data quality or assumptions.

Tool 6: Data analysis and live dashboards with Claude (continued)

COPY-PASTE PROMPT Ask for a governing question first

COPY-PASTE PROMPT Before analysing the dataset, propose five possible governing questions. For each, explain why an executive would care, which fields can answer it, which fields are missing and what decision it could inform. Recommend the strongest question and wait for my approval before building charts.

Example governing questions for an online retailer

- Which product categories contribute the strongest combination of revenue and margin?
- Where are customers abandoning the purchase journey?
- Which support topics generate the greatest workload?
- Which customer segments show repeat-purchase potential?
- Which inventory patterns create the greatest stock-out risk?

Interpretation rules

Use correlation carefully. Separate descriptive findings from causal claims. Every metric should have a clear denominator, unit and time period. Where data is incomplete, label the limitation rather than estimating a missing value.

Recommended dashboard sections

- Executive KPI summary
- Revenue and order trend
- Category performance
- Customer segment view
- Support workload
- Inventory risk
- Filters for date, category and channel

Tool 7: Learn faster with NotebookLM

COPY-PASTE PROMPT Build a source-grounded learning notebook

COPY-PASTE PROMPT Topic: AI for e-commerce operations

Learning goal: Understand how AI can improve product discovery, customer support, merchandising and workflow automation.

Current level: beginner / intermediate

Time available: []

Use only the sources in this notebook.

Create:

1. A concept map of AI in e-commerce.
2. The 20% of concepts that unlock 80% of understanding.
3. A step-by-step learning path.
4. Common misconceptions.
5. Practical examples connected to my role: [role].
6. Five questions that test real understanding, not memorisation.
7. A list of source gaps where the notebook cannot answer confidently.

Cite the supporting source for every important claim.

COPY-PASTE PROMPT Custom instructions for an Audio Overview

COPY-PASTE PROMPT Create an audio overview for a busy e-commerce manager. Use English language. Focus on practical intuition and examples, not technical jargon. Structure it as: why this matters; three core ideas; one realistic retail example; common mistake; five-minute action I can take today. Keep it approximately [X] minutes.

Tool 7: Learn faster with NotebookLM (continued)

COPY-PASTE PROMPT Interactive question during the audio

COPY-PASTE PROMPT Pause and explain [AI product recommendation / customer-support automation] as if I am a non-technical retail manager. Use one analogy, one work example and one counterexample. Then ask me one question to check whether I understood it. Use only the notebook sources and tell me when the sources are insufficient.

COPY-PASTE PROMPT Generate a retrieval practice pack

COPY-PASTE PROMPT From the notebook sources, create 15 flashcards, 10 scenario-based multiple-choice questions, 5 short-answer questions, an answer key with source references and a one-page revision sheet. Make distractors plausible. Test application and judgement, not only definitions.

Tool 8: Complete the roadmap — products, automations and AI employees

COPY-PASTE PROMPT No-code MVP product brief

COPY-PASTE PROMPT Best for: Lovable, Replit, AI Studio or other builders. Add first: a real recurring e-commerce pain point.

Act as a product manager and no-code solution architect.

Problem: [describe a repeated retail problem]

User: [specific user]

Current workaround: [how they solve it today]

Desired outcome: []

Constraints: [time, budget, data, platform, technical level]

Create:

1. One-sentence problem statement.
2. Job-to-be-done and top user pains.
3. Assumptions that must be validated.
4. Smallest viable workflow — not a feature-heavy app.
5. PRD with user stories and acceptance criteria.
6. Recommended no-code / AI tool stack with reasons.
7. Data model and integrations.
8. Privacy, permission and failure considerations.
9. Build sequence for a first working prototype in [X] days.
10. User test script and success metrics.

Tool 8: Complete the roadmap — products, automations and AI employees

COPY-PASTE PROMPT Automation blueprint

COPY-PASTE PROMPT Best for: n8n, Zapier, Make or workflow tools. Add first: a documented repeatable e-commerce process.

Act as an automation architect.

Process today: [describe the manual steps]

Start condition / trigger: []

Inputs and systems: []

Desired output: []

Volume and frequency: []

Exceptions: []

Return a table with:

Step	Trigger / Input	Action	Tool / System	Data Passed	Validation	Failure Path	Human Approval
1	New order	Read order details	Store / sheet	Order ID, items	Required fields	Log and retry	No
2	Order status	Check delivery state	Order system	Status	Valid status	Escalate	Sometimes
3	Customer issue	Draft response	AI assistant	Question + policy	Policy match	Route to human	Yes

Then recommend the smallest version to automate first. Include duplicate prevention, logging, retries, privacy and a manual fallback. Do not automate a step whose decision criteria are not yet clear.

COPY-PASTE PROMPT AI employee specification

COPY-PASTE PROMPT Best for: assistants, agents and internal AI systems. Add first: role, process documents and permission boundaries. Design an AI teammate for this role: E-commerce Operations Assistant.

Define:

1. Mission and measurable outcomes.
2. Tasks it may perform independently.
3. Tasks that require human approval.
4. Knowledge sources and update frequency.
5. Tools and permissions it needs.
6. Standard operating procedure for each core task.
7. Input and output formats.
8. Quality checks and evaluation rubric.
9. Safety, privacy and compliance guardrails.
10. Escalation rules and failure recovery.
11. Memory: what it should remember and what it must not store.
12. A 14-day pilot plan with success metrics.

AI Employee Card

Role: E-commerce Operations Assistant | Responsibilities: order-status triage, FAQ drafting, product-data cleanup and issue routing | Tools: store system, spreadsheet, knowledge base and approved AI service | Guardrails: no autonomous refunds, no disclosure of private customer data, human approval for exceptions | Escalation: route policy conflicts, high-value complaints and uncertain cases to the designated human owner.
